

Using the Social Humanoid Robot Pepper for Training Tasks

Peter Forbrig & Alexandru Bunea

Peter.Forbrig@uni-rostock.de

- Introduction
 - Stroke statistics
 - Training tasks for post-stroke patients
 - Digitalisation of training tasks
- Social-Humanoid Robot Pepper as motivator
 - Replacement of the therapist after first training
 - Specification of collaboration
 - Interaction design
 - Models of patients
- Discussion of challenges
- Outlook

- **Stroke** is currently a very important disease.
- According to the American Heart Association Statistics Committee and Stroke Statistics Subcommittee in 2017 every 40 seconds someone in the United States had a stroke.
- Every four minutes, someone died of stroke.
- Even that this is bad news, it means that a lot of stroke patients survive. However, they have to cope with defects. Often one arm is disabled, which creates a lot of problems for the daily life.
- Fortunately, there are opportunities to train the brain in not affected areas in such a way that patients can recover.

The patient is asked to imagine that the hand in the mirror is his Disabled arm.

Several exercises have to be performed.

Training with a supportive person.

- Within the project
E-BRAiN
(Evidence-based Robot-Assistance in
Neurorehabilitation)
we want to develop software that allows a social
humanoid robot to give instructions to perform and to
observe carefully selected exercises and provide
feedback.
- In addition, the robot should motivate patients in continuing
their training tasks.
- The team consists of researchers from Medicine,
Psychology, Sociology and Computer Science.

- Time left is 10 seconds
(Zeit: 10)
- Reached points is 53
(Punkte: 53)
- Green means success
- Red means failure
(attempt has to be repeated)

Zeit ist um!

Punkte: 2

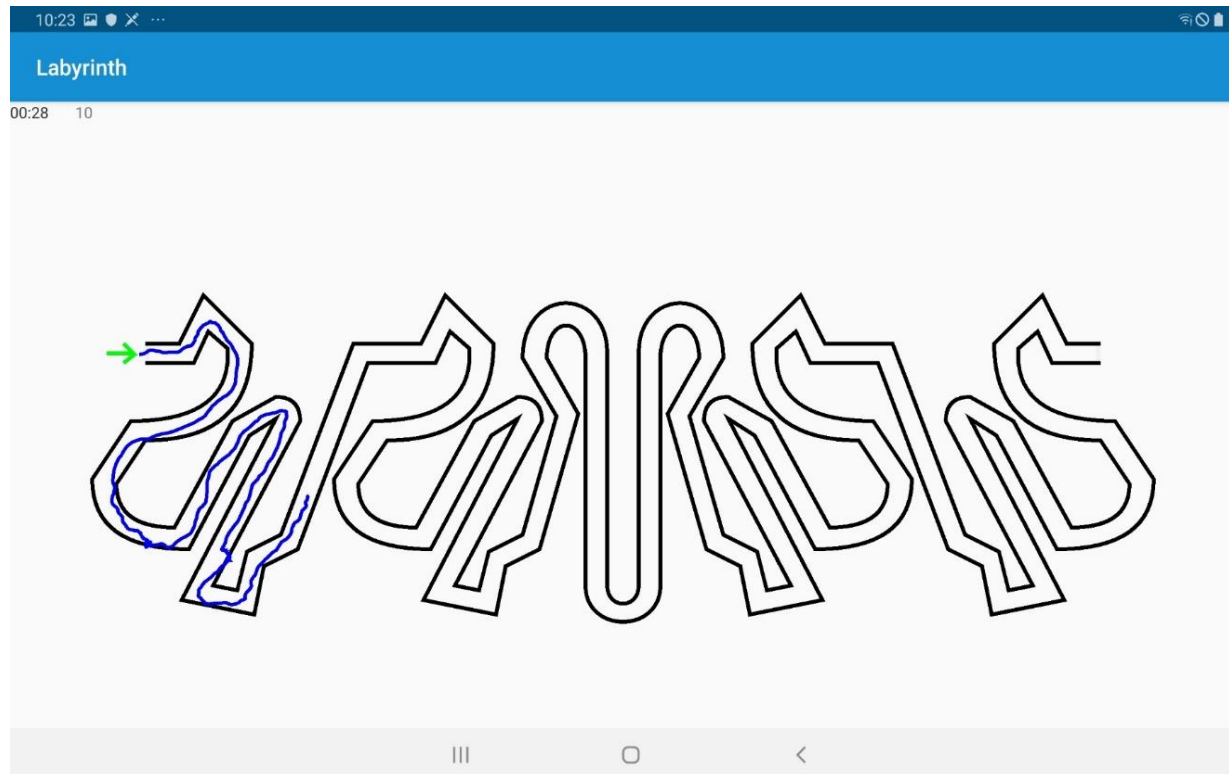

:

Arrow signals result of previous exercise.

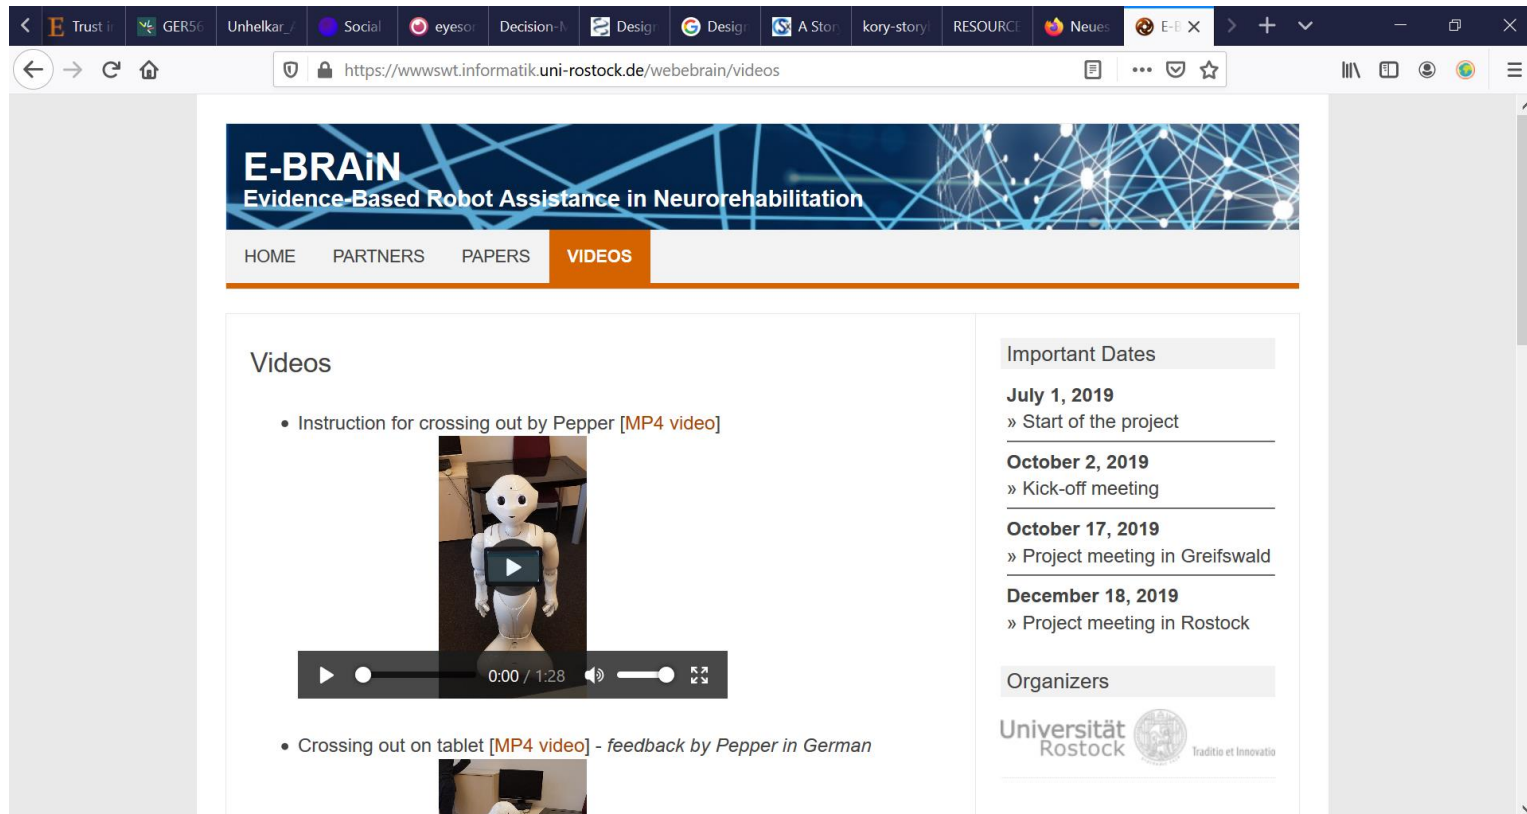

Graph on the Pepper tablet presents a results history.

- Errors result in one second penalty – reduced from the time left.
- Result of the exercise is the percentage of the reached path in one minute. It can vary from 0 to more than 100 if a second labyrinth is started

The screenshot shows a web browser window with the URL <https://wwwswt.informatik.uni-rostock.de/webebrain/videos>. The website header features the E-BRAIN logo and the tagline "Evidence-Based Robot Assistance in Neurorehabilitation". The navigation menu includes HOME, PARTNERS, PAPERS, and VIDEOS (which is highlighted). The main content area is titled "Videos" and lists two items:

- Instruction for crossing out by Pepper [MP4 video]
- Crossing out on tablet [MP4 video] - feedback by Pepper in German

The first video is currently playing, showing a Pepper robot. The video player controls show a progress bar at 0:00 / 1:28. To the right of the video list, there is a section titled "Important Dates" with the following entries:

- July 1, 2019**
» Start of the project
- October 2, 2019**
» Kick-off meeting
- October 17, 2019**
» Project meeting in Greifswald
- December 18, 2019**
» Project meeting in Rostock

Below the dates is a section titled "Organizers" which includes the University of Rostock logo and the tagline "Traditio et Innovatio".

<https://wwwswt.informatik.uni-rostock.de/webebrain/videos/>

- Modelling of collaborative activities of patient, supporter and robot.
- Designing a Domain Specific Language (DSL) for the robot.
- Connection of the robot with devices (e.g. Tablet, Smart Phone)
- Code generation for the robot
- Interaction with the robot by gestures or „Tangible User Interfaces“.
- . . .

- **Challenge 1:** How can sentences be formulated to motivate a patient in the right way?
- **Challenge 2:** What are the important attributes for the user model?
- **Challenge 3:** Which kind of information has to be presented to a patient when?
- **Challenge 4:** Specification of a DSL that allows the specification of collaborative activities of humans and robots and additionally the generation of code for robots.
- **Challenge 5:** For which kind of patients is assistance by a social humanoid robot like Pepper appropriate?

First ideas of attributes for user modelling

1. Personal data (persistent data)
2. Personal therapy data (persistent data)
 - 2.1. personal goals
 - 2.2. medical conditions
3. Exercise-related data (dynamical data)
4. Emotional state data (dynamical data)
5. History of interactions (dynamical data)

● DSL-CoTaL

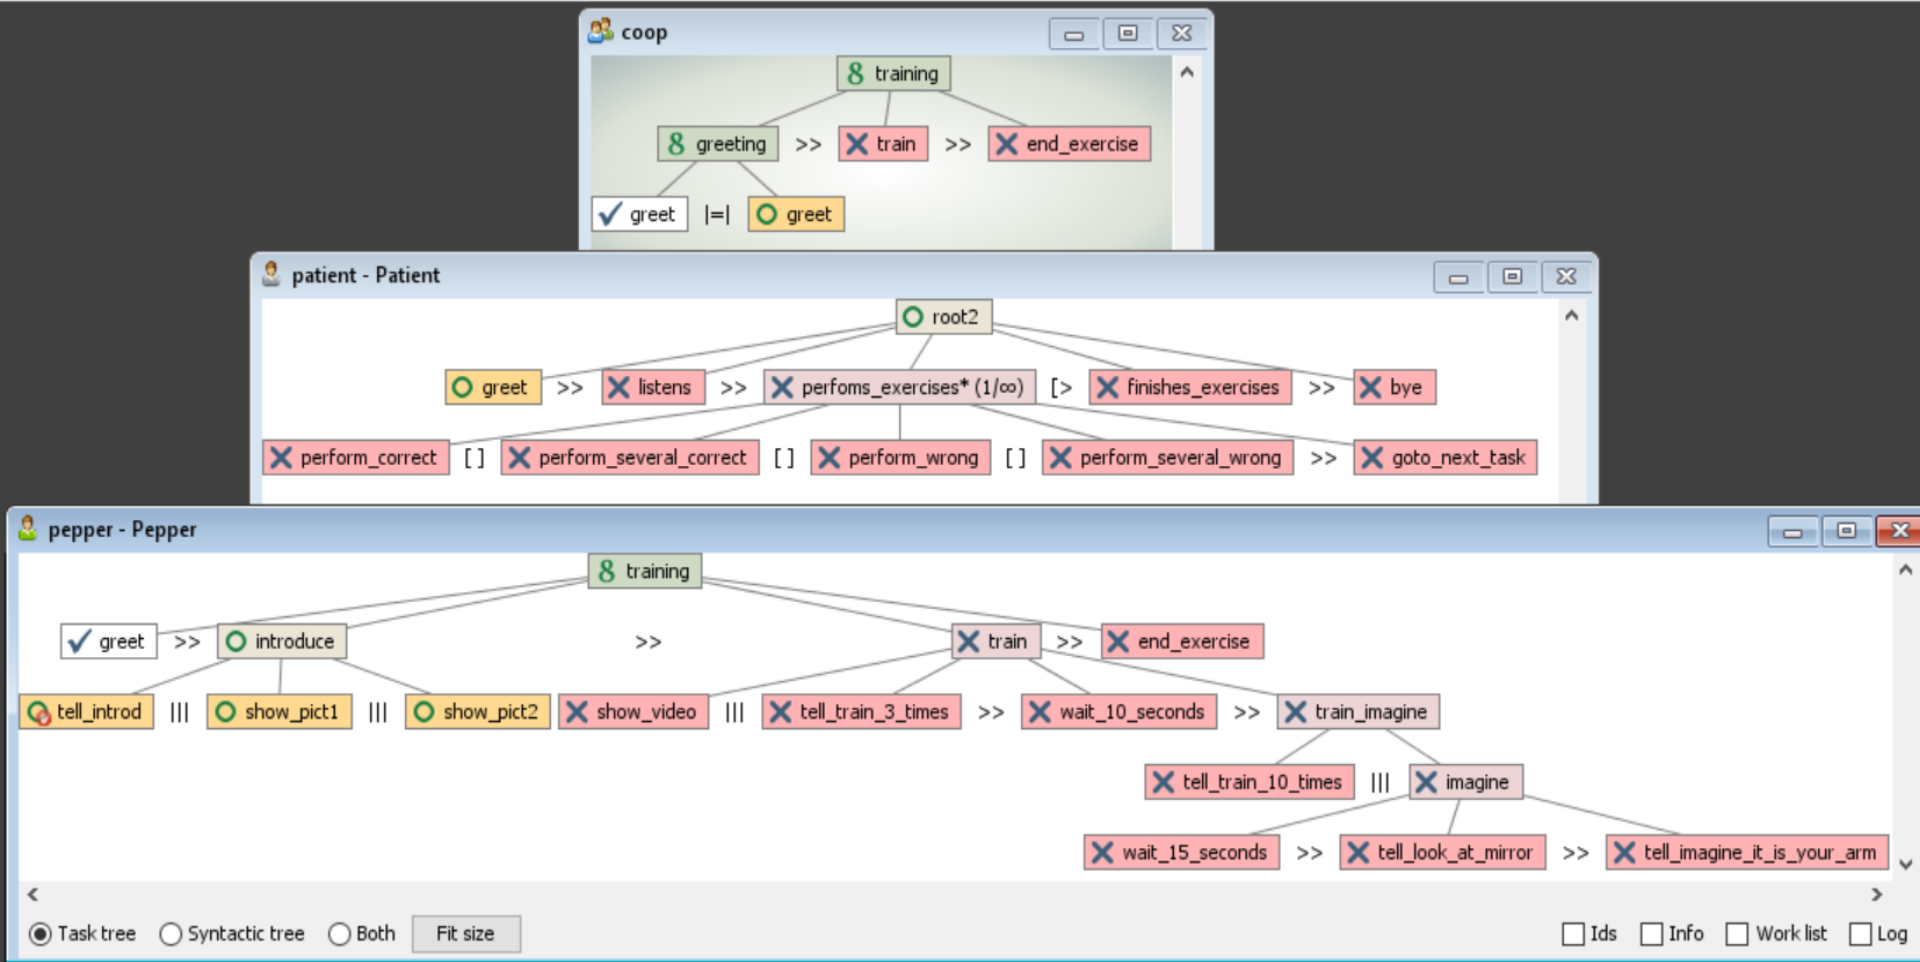

- Domain-Specific Language for modelling cooperative tasks
- Consist of one team model and several role models
- Code can be generated to tools like CTTE, HAMSTERS and CoTaSE.

```
role test {
  root task0 = task1 >> task2 ||| task3
  task task1 = task11 >> task12
}
```

DSL-CoTaL

CTTE

- say(Text)
- say_loud(Text)
- blink_with_eyes(Seconds)
- raise_left_arm
- raise_right_arm
- move_ahead(Centimeter)
- turn_right
- turn_right(Degrees)
- turn_left
- turn_left(Degrees)
- turn_back
- sleep(Seconds)|

- **Challenge 5:** For which kind of patients is assistance by a social humanoid robot like Pepper appropriate?

Hints would be appreciated!

This joint research project “E-BRAiN - Evidence-based Robot Assistance in Neurorehabilitation” is supported by the European Social Fund (ESF), reference: ESF/14-BM-A55-0001/19-A01, and the Ministry of Education, Science and Culture of Mecklenburg-Vorpommern, Germany. This work was further supported by the BDH Bundesverband Rehabilitation e.V. (charity for neuro-disabilities) by a non-restricted personal grant to TP. The sponsors had no role in the decision to publish or any content of the publication.

Thank you very much for your attention.
